Find the eigenvalues and eigenfunctions for the Sturm-Liouville eigenvalue problem and use explicit computation to show that different eigenfunctions are orthogonal.

$$\phi''(x) + \lambda \phi(x) = 0$$
, $\phi(0) = 0$, $\phi'(L) = 0$.

Solution.

$$\phi_n(x) = A \sin\left(\left(n - \frac{1}{2}\right) \frac{\pi x}{L}\right), \quad \lambda_n = \left(\left(n - \frac{1}{2}\right) \frac{\pi}{L}\right)^2, \quad n = 1, 2, \dots,$$

where A is an arbitrary constant. To compute $\int_0^L \phi_n(x)\phi_m(x)dx$, the following identity is useful:

$$\sin \alpha \sin \beta = \frac{1}{2} [\cos(\alpha - \beta) - \cos(\alpha + \beta)].$$

Apply the boundary conditions:

So
$$\varphi(x)=0$$
, not acceptable to be eigenfunction

The equation becomes $y''(x) - \mu^2 \varphi(x) = 0$

$$\varphi(x) = A\mu e^{\mu x} - A\mu e^{\mu x} \varphi(L) = 0 \Rightarrow A\mu (e^{\mu x} - e^{\mu x}) = 0$$

$$\Rightarrow A = 0$$

Case 3 N=k² for some k>0 The equation becomes $y''(x) + k^2p(x) = 0$ beneral sol: yex) = A cos (kx) +Bsh(kx) 9(0)=0 = C=0 y'(x)=Bkcos(kx) => y(L)=Bkcos(kL)=0 $B=0 \implies bivid$ sol

B to => cos (+L)=0, KL=(n-±TT), NEW

So eigenvalues are $\lambda_1 = k_1^2 = (u-1)f)^2$ corresponding eigenfunctions (Pn(x) = B sin(kn)) = Bsin($(x-\frac{1}{2})\frac{2x}{L}$)

WTS:
$$\forall \land \neq m \circlearrowleft \int_{0}^{L} \varphi_{\Lambda}(x) \varphi_{m}(x) dx = 0$$

$$I = \int_{0}^{L} \varphi_{\Lambda}(x) \varphi_{m}(x) dx = \int_{0}^{L} \sinh((n-\frac{1}{2})\frac{\pi}{L}x) \sin((m-\frac{1}{2})\frac{\pi}{L}x) dx$$

$$=\frac{1}{2}\int_{0}^{L}\left[\cos\left((n-m)\frac{T_{1}x}{L}\right)-\cos\left((n+m-1)\frac{T_{1}x}{L}\right)\right]dx$$

$$=\frac{1}{2}\left[\frac{L}{(n-m)\pi}\sin((n-m)\frac{\pi x}{L})\right]_{0}^{L}-\frac{1}{2}\left[\frac{L}{(n+m-1)\pi}\sin((n-m-1)\frac{\pi x}{L})\right]_{0}^{L}$$

Thus eigenfunctions are orthogonal over [0,L]

 $\phi''(x) + \lambda \phi(x) = 0, \quad \phi'(0) = 0, \quad \phi(L) = 0.$

Find the eigenvalues and eigenfunctions for the Sturm-Liouville eigenvalue problem:

 $\phi_n(x) = A\cos\left(\left(n - \frac{1}{2}\right)\frac{\pi x}{L}\right), \quad \lambda_n = \left(\left(n - \frac{1}{2}\right)\frac{\pi}{L}\right)^2, \quad n = 1, 2, \dots,$

$$\phi_n(x) = A\cos\left(\left(n-\frac{1}{2}\right)\frac{n\omega}{L}\right), \quad \lambda_n = \left(\left(n-\frac{1}{2}\right)\frac{n\omega}{L}\right) \ , \quad n \in \mathbb{R}$$
 where A is an arbitrary constant.

(wel 1=0 =) 9"(x)=0 => 4(x)=C,x+6

$$\varphi(0) = G = 0$$
 $\varphi(L) = G_2 = 0 \Rightarrow \varphi = 0$, toisial sol
Case 2 $\lambda = \mu^2$ for some $\mu \neq 0$

Y(x) = Aexx+ Bexx φ(x) = Aμe+x-βμe+x. φ'(0) =0 => A=B

$$4 = 0 \Rightarrow A(e^{nL} - e^{nL}) = 0$$

$$4 = 0 \Rightarrow A = 0$$

$$L_{1}\mu > 0 \Rightarrow A = 0 \Rightarrow bivial sol.$$

Cove3 1: k2 for some k>0 9"(x)+ k=9(x)=0

$$\psi(x) = A\mu e^{-1}O\mu e^{-1} \cdot \psi(x) = 0$$

$$\psi(x) = 0 \implies A(e^{\mu L} - e^{\mu L}) = 0$$

general sol:
$$\varphi(x) = A \cos(kx) + B \sin(kx)$$

 $\varphi'(x) = -Ak \sin(kx) + Bk \cos(kx), \ \varphi'(x) = Bk = 0 \Rightarrow B = 0$
 $\varphi(L) = A \cos(kL) = 0 \Rightarrow k = (n-\frac{1}{2}) \frac{\pi}{L}, \ n \in \mathbb{N}$

So eigenvalues $n = k_n^2 = (n-\frac{1}{2})^T$ eigenfunctions Prix) = A as (knx) = A as (n-1) (x)

Find the eigenvalues and eigenfunctions for the Sturm-Liouville eigenvalue problem:

$$\phi''(x) + \lambda \phi(x) = 0, \quad \phi(0) = \phi(L), \quad \phi'(0) = \phi'(L).$$

Solution.
$$\phi_n(x)=A\cos\left(\frac{2n\pi x}{L}\right)+B\sin\left(\frac{2n\pi x}{L}\right),\quad \lambda_n=\left(\frac{2n\pi}{L}\right)^2,\quad n=1,2,\ldots,$$

and
$$\phi_0(x)=C, \quad \lambda_0=0,$$

where A, B, and C are arbitrary constants. (The orthogonality theorem can be extended to the case of periodic boundary conditions.)

$$\varphi(x) = C_1 x + C_2$$

$$\varphi(x) = \varphi(L) \Rightarrow C_1 = 0 \Rightarrow C_1 = 0$$

$$\varphi'(0) = \varphi'(L) \Rightarrow Cx = Cx$$
, nothing implied

There
$$\varphi(x) = C$$
, Constant

Cose2
$$\Lambda = -\mu^2$$
 for some $\mu > 0$

$$\varphi(x) = Ae^{\mu x} + Be^{-\mu x}$$

$$\varphi(0) = \varphi(1) \implies A + B = Ae^{\mu 1} + Be^{-\mu 1} D$$

$$\varphi'(0) = \varphi'(L)$$

$$\Rightarrow \mu(A - B) = \mu(Ae^{\mu L} - Be^{-\mu L})$$

$$\Rightarrow \mu(A-B) = \mu(Ae^{\mu L}-Be^{\mu L})$$

$$A-B = Ae^{\mu L}-Be^{\mu L}$$

Similarly set B=0. So the solution is trivial

Coses N=K2 for some k>0

P(X) = A US (low) + B sin(low)

\$10) = P(L) => A = A 05 (KL) + BSINCKL)

A (1-cos (KL)) = B SIN (KL) 0

φ'm = φ(L) => BK = -AKSIN (KL) +BK cos (KL)

B(1-wikh)=-Asin(kh)

ByO, B= A(1-us(u)) = (1-cospu) = - (in(ku)) alway 20 always 50

So 1- uskl) = sinkl) =0

=> K=2/T, NEW

So eigenvalues $n = k_n^2 = \left(\frac{2h_{11}}{L}\right)^2$ eigenfunctions $y_n = A \cos\left(\frac{2n\pi\gamma}{L}\right) + B \sin\left(\frac{2n\pi\gamma}{L}\right)$

bogether with in cose 1, 16=0

Solve the initial-value problem for the heat equation $u_t = Ku_{zz}$ with the boundary conditions $u(0,t) = T_1$,

Question 4

 $u_z(L,t) = \Phi_2$, and the initial condition $u(z,0) = T_3$, where K, T_1, Φ_2 , and T_3 are positive constants. Solution.

$$u(z,t) = T_1 + \Phi_2 z + \sum_{n=1}^{\infty} A_n \sin\left(\left(n - \frac{1}{2}\right) \frac{\pi z}{L}\right) \exp\left(-\left(\left(n - \frac{1}{2}\right) \frac{\pi}{L}\right)^2 Kt\right),$$
 where

$$A_n = rac{2(T_3 - T_1)}{\left(n - rac{1}{2}
ight)\pi} - rac{2L\Phi_2(-1)^{n+1}}{\left(n - rac{1}{2}
ight)^2\pi^2}.$$

$$U(2,t) = V(2) + W(2,t)$$

O Solve steady-state sol $V(2)$;

$$S_{2} V(2) = \phi_{2}^{2} + T_{1}$$

$$\sqrt{(2)} = \phi_2^2$$

$$\sqrt{(2)} = \psi_2^2$$

$$= \text{transient}$$

WCO,t)= U(0,t)- WO) = Tr- Ti =0

Find separated sol for west):

Wz(Lit) = U2(Lit) - V2(L) = \$\phi_2 - \phi_2 = D_

Wz, t) = X(2)T(t)

W(2,0) = ((12,0)-V(2) = T3-(022+T1) = T3-T1-02

X(2) T(4) = KX1(2) T(4)

$$\frac{T'(\mathcal{U})}{\mathsf{K}T(\mathcal{U})} = \frac{\mathsf{X}'(\mathcal{U})}{\mathsf{X}(\mathcal{U})} = -1$$

$$\frac{1}{|X|} = \frac{x}{|X|} = -\lambda$$

$$\Rightarrow T(t) + |X| = 0, X$$

$$\overline{KTU} = \frac{1}{X(2)} = -1$$

$$\Rightarrow T'(U+K\Lambda T(U) = 0 , X'$$

Sol for
$$\Theta$$
; by previous problem,
only have sol when $\Lambda = k^2$ for some $k > 0$

only have sol when
$$\Lambda = k^2$$
 for some kzo

general sol:
$$X(2) = A \cos(kz) + B \sin(kz)$$

 $X(0) = 0 \implies A = 0$

$$X(L) = 0 \implies Bk cos(LL) = 0 \implies k = (n-1) \frac{\pi}{L}, new$$
So $X_{\Lambda}(2) = B_{\Lambda} sin((n-1) \frac{\pi 2}{L}), \Lambda \in \mathbb{N}$

Wes the transient sol:

$$\frac{1}{2} \int_{-\infty}^{\infty} dx \, dx = \sum_{i=1}^{\infty} B_{ii} \int_{-\infty}^{\infty} dx$$

This solves the transient sol:

$$w(z,t) = \sum_{n=1}^{\infty} B_n \sinh((n-z) \frac{\pi z}{L}) e^{-k(n-z) \frac{\pi z}{L}} t$$

(3) determine the coeffs B_n

$$w(z,0) = T_3 - T_1 - \Phi_3 z = \sum_{n=1}^{\infty} B_n \sinh((n-z) \frac{\pi z}{L})$$

Let $f(z) = (T_3 - T_1) - \Phi_2 z$

Expand
$$f(2)$$
 by Fourier sine sines:
$$f(2) = \sum_{n=1}^{\infty} B_n \sin (2n+2)$$

where
$$d_n = (n-\frac{1}{2})\frac{T}{t}$$

$$= \int_0^1 f(z) \sin(dmz) dz - \int_0^2 \sin(dnz) \sin(dmz) dz$$

Since
$$\int_0^L \sin(\alpha n z) \sin(\alpha m z) dz = \frac{1}{2} \delta mn$$

we have $B_n = \frac{2}{L} \int_0^L f(z) \sin(\alpha n z) dz$

$$= \frac{1}{2} \left(\frac{1}{2} - \frac{1}{2} \right) \int_0^L \sin(\alpha n z) dz - \frac{1}{2} \int_0^L 2 \sin(\alpha n z) dz$$

$$= \frac{1}{L} \left[(I_3 - I_1) \int_0^L \sin(dx + i) dx - i dx \int_0^L 2 \sin(dx + i) dx \right]$$

$$= \frac{2}{L} \left[(L_3 - I_1) \int_0^L - i dx \frac{(-1)^{n+1}}{dx^2} \right]$$

$$= \frac{2(t_3-t_1)}{(h-\frac{1}{2})t_1} - \frac{2(t_3-t_1)}{(h-\frac{1}{2})^{\frac{1}{2}t_1^2}} - \frac{2(t_3-t_1)}{(h-\frac{1}{2})^{\frac{1$$

Therefore
$$T_1 + \phi_2 Z + \sum_{n=1}^{\infty} \left[\frac{2(T_3 - T_1)}{(n-\frac{1}{2})^{\frac{n}{2}}} - \frac{2L\phi_2(-1)^{\frac{n}{2}}}{(n-\frac{1}{2})^{\frac{n}{2}}} \right] sn((n-\frac{1}{2})^{\frac{n}{2}}) e^{-\frac{1}{2}(n-\frac{1}{2})^{\frac{n}{2}}}$$

$$n \in \mathbb{N}$$

NOW

Let us consider heat flow in a circular ring of circumference L.

- 1) Find all of the separated solutions of the heat equation $u_t = Ku_{zz}$ (K > 0) satisfying the periodic boundary conditions u(0,t) = u(L,t) and $u_z(0,t) = u_z(L,t)$.
 - 2) Solve the heat equation $u_t = Ku_{zz}$ (K > 0) satisfying the periodic boundary conditions u(0,t) =
- u(L,t), and the initial conditions u(z,0) = 100 if 0 < z < L/2 and u(z,0) = 0 if L/2 < z < L.

Solution. 1)
$$u_n(z,t) = \left(A_n \cos \frac{2n\pi z}{L} + B_n \sin \frac{2n\pi z}{L}\right) \exp\left(-\left(\frac{2n\pi}{L}\right)^2 Kt\right), \quad n = 0, 1, 2, \dots$$

$$u(z,t) = 50 + \frac{100}{\pi} \sum_{n=1}^{\infty} \frac{1 - (-1)^n}{n} \sin \frac{2n\pi z}{L} \exp\left(-\left(\frac{2n\pi}{L}\right)^2 Kt\right).$$

1) Suppose u(2,t)=X(2) [Ct)

$$\frac{T'}{KT} = \frac{X''}{X} = -\lambda$$

D has non bried sol only when
$$\lambda = k^2$$
 for some $k > 0$
And sol is $\times_{\Lambda} (2) = A_{\Lambda} \cos(\frac{2\pi \sqrt{4}}{L}^2) + B_{\Lambda} \sinh(\frac{2\pi \sqrt{4}}{L}^2)$

Thus the separate sol is

$$U_{n}(2st) = \left(A_{n}\cos\left(\frac{2n\pi z}{L}\right) + B_{n} \sinh\left(\frac{2n\pi z}{L}\right)\right) e^{-\left(\frac{2n\pi z}{L}\right)^{\frac{2}{2}}}$$

$$n \in \mathbb{N}$$

$$V(2,0) = G_0 + \sum_{n=1}^{\infty} \left(a_n \cos \left(\frac{2NT^2}{L} \right) + b_n \sin \left(\frac{2NT^2}{L} \right) \right)$$

$$a_0 = \frac{1}{L} \int_0^L u(2,0) d2 = \frac{1}{L} \int_0^{\frac{L}{L}} |u| d2 + \int_{\frac{L}{L}}^L 0 d2$$

$$=\frac{200}{L}\left[\frac{L}{2rtt}\sin\left(\frac{2rtt^2}{L}\right)\right]^{\frac{L}{2}}=0$$

$$= -\frac{100}{100} (100(NT) - 1)$$
$$= -\frac{100}{100} (100(NT) - 1)$$
